DO STUFF WITH _THIS

Julien Fiegehenn (simbabque)

You have a directory that you want to share over the web

but you don't have a webserver handy

`http_this`

written by Pedro Melo

What about making it secure?

Input parameter for perl CGI script

0

I need some insight on my Perl CGI script.

First of all all this is running under webmin so i'm doing a custom module.

I'm calling a CGI Perl script passing 2 parameter from another Perl CGI. The link I'm calling is in the following format:

```
http://IP:8080/foobar/alat.cgi?sysinfo=xxxxxxx&SR=yyyyyyyy
```

The alat.cgi script look like this

```
#!/usr/bin/perl
use CGI qw(:standard);
ReadParse();
$q = new CGI;
my $dir = $in->param('SR');
my $s = $in->param('sysinfo');
ui_print_header(undef, $text{'edit_title'}.$dir, "");
print $dir."<br>";
print $s"<br>";
```

The only output I get printed is the value of `$dir` and `$s` seems to be empty.

What am I doing wrong?

perl cgi

WHY CGI.PM SUCKS
• CGI.pm is slow
• CGI.pm is heavy
• CGI.pm is ugly
• CGI.pm is old
• CGI.pm is not safe
• CGI.pm is exhausting
• CGI.pm is confused
• ...
• Yo mama!
